

PEL-3000A/3000AH Series

Programmable DC Electronic Load

FEATURES

- Operating Voltage (DC): 0 V to 150 V(PEL-3000A)/0 to 800 V(PEL-3000AH)
- Operating Mode: CC/CV/CR/CP/CC+CV/CR+CV/CP+CV
- . Parallel Connection of Inputs for Higher Capacity (Max: 9,450 W)
- Support of High Slew Rate : Max 16 A/μs(PEL-3000A)/0.84 A/μs(PEL-3000AH)
- Run Program Function (Go/NoGo Test)
- . Sequence Function for High Efficient Load Simulations
- . Dynamic (Switching) Function: 0.0166 Hz to 20 kHz
- . Soft Start Function: Off/On (1 ms to 200 ms, Res. 1 ms)
- Adjustable OCP/OVP/OPP/UVP Setting
- Short Circuit Function
- · Timer Function: Elapsed Time of Load on
- . Cut Off Time (Auto Load Off Timer): 1 s to 999 h 59 min 59 s or Off
- External Channel Control/Monitoring Via Analog Control Connector
- Setup Memories: 100 sets
- 3.5 Inch TFT LCD Display
- Multi Interface: USB, RS-232/RS-485/LAN, GPIB(Optional)

Mess- und Prüftechnik. Die Experten.

Simply Reliable

Flexible Power Combinations, High-Speed and Versatile Load Simulations

The PEL-3000A Series, a single-channel, programmable DC electronic load with 0.01 mA current resolution and 16 A/ μ s current Slew Rate, is very ideal for testing SPS (Switching Power Supply) for commercial and industrial computers. The flexible power combination of PEL-3000A Series meets the test requirements of present high-power power supply. The PEL-3000AH Series programmable DC Electronic load, which not only inherited functions and features from the PEL-3000A Series but providing three current ranges for all PEL-3000AH Series and adding voltage monitor BNC terminals on the front panel. The PEL-3000AH Series, a single-channel, programmable DC electronic load with 800 V and 0.84 A/ μ s current Slew Rate, is ideal for the test of the high voltage devices such as DC/DC converters or high-voltage batteries. With respect to battery testing applications such as rechargeable battery for electrical tools, battery module and automobile battery, PEL-3000A(AH) Series has three stand-alone models to offer including 175 W, 350 W, 1050 W and Booster. By connecting Booster 2100 W units with master units, the maximum load capacity of the whole system can reach 9,450 W. Hence, the PEL-3000A(AH) Series fulfills various power testing requirements including medium to low power or high-power power supply.

The PEL-3000A(AH) Series has seven operating modes and three operating functions. Among the seven operating modes, four of them are basic operating modes, including constant current, constant voltage, constant resistance, and constant power, and the other three are advanced operating modes including constant current + constant voltage, constant resistance + constant voltage, and constant power + constant voltage. Users must first select operating mode and then operating function based upon the test requirements. Static, Dynamic and Sequence operating functions can be applied to different testing conditions including a fixed load level, switching between two levels or switching among more than two levels. Sequence function is divided into Fast Sequence and Normal Sequence according to the test time of each step. Both Dynamic and Sequence are to assist users to simulate the genuine load change. For instance, PEL-3000A(AH) Series can simulate HEV current consumption to make sure that automobile battery can supply HEV with sufficient power need on the road. By so doing, manufacturers can elevate product quality and reliability.

The Soft Start function of the PEL-3000A(AH) Series can set current rise time for the moment PEL-3000A(AH) Series is turned on to reduce the abnormal situation of the voltage drop of power supply under test. The adjustable Under Voltage Protection (UVP), GO/NO GO voltage input monitoring function, current monitoring function and Timer Function to control load activation time can be jointly applied to the characteristic tests of battery bleeding to avoid battery damage during bleeding operation. Based upon the functionalities described above, the PEL-3000A(AH) Series can test a vast variety of power supply ranging from the fundamental static sink current to complex dynamic load simulations so as to enhance product quality and reliability.

The single unit D.C Electronic Load of PEL-3000A(AH) Series

The PEL-3000A(AH) Series is a high speed, single channel and programmable D.C. electronic load and its power, functionality, parallel combination and size are listed on the following chart:

MODEL	PEL-3021A(AH)	PEL-3041A(AH)	PEL-3111A(AH)	PEL-3211A(AH)	
Power	175 W	350 W	1,050 W	2,100 W Booster	
Function	Full-function Single Unit	Full-function Single Unit	Full-function Single Unit	No control panel, can not be operated alone	
Parallel	Parallel with same model, 5 units the	Parallel with same model, 5 units the	Parallel with same model, 5 units the maximum	Parallel with PEL-3111A(AH)	
Combination	maximum	maximum	Parallel with the maximum of four PEL-3211A(AH)s		
Size	Half Rack	Half Rack	Full Rack	Full Rack	

OPERATING FUNCTION FOR MASTER AND SLAVE IN PARALLEL

Three PEL-3021A(AH) in Parallel

PEL-3000A(AH) Series connects with loads via MIL 20-pin interface and connecting cables to designate a master to control other slave units in parallel. One PEL-3111A(AH) and four PEL-3211A(AH) in parallel provide the maximum power of 9,450 W.

One PEL-3111A(AH) connects with two PEL-3211A(AH) in Parallel

Parallel arrangement allows users to flexibly select and apply different power arrangement which enhances equipment utilization efficiency to save R&D cost.

R

OPERATING MODE

The PEL-3000A(AH) series provides four fundamental operating modes and three add-on modes of CC, CR and CP separately combining with CV. Users can set different load condition under different operating modes such as setting operating range for load level, Current Slew Rate, input voltage and load current.

The input voltage range has two levels - high and low. The load current operating range has three levels - high, medium and low current levels which possess different resolution to meet test requirements of different power product specifications.

Source Voltage V CR Mode

Under constant current mode, electronic load will sink the amount of current users has set. Different current settings via CC mode allow users to test the voltage changes of DC power supply which is called load regulation test.

Under constant resistance mode, electronic load will sink load current, which is linearly direct proportion to input voltage. This mode can be utilized in testing voltage or the activation and current limit of power supply.

Under constant voltage mode, electronic load will sink sufficient current to regulate the voltage source to the set value. This mode allows users not only to test current limit function of power supply, but also to simulate battery operation in testing battery chargers.

Under constant power mode, electronic load will sink load current, which is indirect proportion to input voltage to reach preset constant power requirement. Hence, the changes of input voltage will have indirect proportion effect on current sinking so as to reach constant power control.

+CV mode can be selected under CC, CR or CP mode. When +CV mode function is turned on and electronic load sinks more current than the maximum current of power supply under test, electronic load will automatically switch to CV mode. It is because that the current sunk is the maximum current of power device. Therefore,

power supply will switch to CC mode and PEL-3000A(AH) will switch to CV mode to limit electronic load from sinking the total current of power supply so as to prevent power supply under test from damaging. Electronic load will cease operation once the voltage of DUT is lower than the set voltage under +CV mode.

THREE OPERATING FUNCTIONS

The PEL-3000A(AH) series, according to different test conditions, step or continuous changes, test speeds, and selectable modes, has three operating functions: Static, Dynamic and Sequence, which can be separately applied on a fixed load test; between two loads; or among more than two loads. Detailed descriptions of these functions are as follows:

Static function provides a fixed load to test output stability of power supply. Switching load value A to B will be manually operated. Under Dynamic function, two test conditions can be switched automatically and every set of parameter includes Level, Timer and Slew Rate. Timer can be set to the fastest of 25 μs to accommodate response time of different power supply and assist testing power supply output status when load is unstable in order to enhance products' reliability and quality.

Operation	er et	Dynamic	Sequence				
Function	Static	Dynamic	Fast	Normal			
Operating Condition Selection	Single fixed condition	Selection between two conditions Selection among more than two conditions		Selection from more than two conditions			
Operating Modes	All modes	Two conditions using same mode CR, CC,CP modes	Each condition must use same mode Support CC or CR mode	Each condition using different mode All modes			
Adjustable Condition Setting	A/B Value Slew Rate	 Level 1/Level 2 Timer 1/Timer 2 (25 μs) Slew Rate 1/Slew Rate 2 	Level Timer Slew Rate	Level Timer Slew Rate			
Sequence Step Combination	N/A	N/A	• 1 Sequence • 25 µs/step • 2560 steps • Res. 1 µs	• 10 Sequence • 10 µs/step • 2560 steps • Res. 10 µs			
Other Functions	N/A	N/A	Trigger Out function	Trigger Out function Ramp function			

In Sequence function, waveforms of load current edited by Fast Sequence are steps and every step can reach the fastest of 25 μs

Fast Sequence Diagram

Normal Sequence provides RAMP function to users, according to their requirements, to select between slope and step method under set time to sink current.

Dynamic Mode

to provide the high slew rate for electronic loads.

Normal Sequence Diagram

By applying a complete sequence editing function, users can control electronic load without using a computer or writing a program so as to save cost and time of R&D.

D. TRIGGER SIGNAL AND CURRENT MONITORING (IMON)

BNC connectors on the front panel

The front panel of PEL-3000A(AH), via BNC connectors provides two output signals, which are Trigger Signal and IMON. Under Dynamic or Sequence function, the moment the load current setting is changed BNC on the front panel will output a 4.5 V and 2 μs pulse voltage. This trigger signal can be set to open or close for every step. Users can use trigger signal to synchronize other devices inside the system.

TRIG OUT = ON

IMON OUTPUT

Current monitoring signals, using a BNC connector to compare with the full scale of real load current, output 0 V to 1 V(0 V to 10 V for PEL-3000AH) at high and low current levels and 0 V to 0.1 V (0 V to 1 V for PEL-3000AH) at medium current level. Therefore, users can monitor load current change without using current probe to save cost.

E. VON VOLTAGE AND VON LATCH FUNCTION

Von Latch = OFF

Von Voltage is the threshold voltage for electronic load to activate or terminate sinking current. When Von Latch is set to off, electronic load operation will be activated if input voltage is higher than Von Voltage and electronic load operation will be terminated if input voltage is lower than Von Voltage. When Von

Von Latch = ON

Latch is set to on, electronic load operation will be activated if input voltage is higher than Von Voltage and will continue operation even input voltage is lower than Von Voltage. Von Voltage function can test the transient maximum current capability provided by power supply.

F. SOFT START

Three different load waveforms of Soft Start Time

Soft Start regulates the time of current rising from 0 to preset value during the moment load is activated. This function is to prevent voltage from dropping due to the fast transient rising speed of load current. Sudden voltage drop will result in an unsuccessful activation of electronic load or DUT and a damaged DUT.

G. PROTECTION MODES

Protection Functions	ОСР	OVP	ОРР	ОТР	UVP	RVP
Adjustable Thresholds	✓	✓	✓	Fixed	✓	N/A
Load Off	✓	✓	✓	N/A	✓	Fixed
Limit Function	1	N/A	1	N/A	N/A	N/A

The PEL-3000A(AH) Series provides many protective functions including over current protection (OCP), over voltage protection (OVP), over power protection(OPP), over temperature protection (OTP) and under voltage protection(UVP). Except for OTP, all thresholds of protective functions are adjustable. When protective function is activated, electronic load will send out warning signal and terminate operation. Other than protective functions, Limit function can also be utilized to maintain electronic load in operation at a preset value. The related settings and selections are as above: Take UVP as an example. In battery bleeding tests, electronic load will cease operation if battery voltage is lower than the set protective threshold value in order to prevent battery from over bleeding.

ANALOG CHANNEL CONTROL

Rear Panel

The PEL-3000A(AH) Series provides the external analog channel control function, which allows users to connect J1 and J2 MIL 20 pin standard connectors on the rear panel to input voltage or to connect resistance to control electronic load operation. Input voltage is limited to the range of 0 V to 10 V; connecting resistance

External Voltage Connection

is limited to the range of 0 Ω to 10 k Ω ; and related to load level are 0 to 100%. For instance, when operating PEL-3021under CC mode and 35 A, external input voltage is 1 V and sink current is 3.5 A. Users can integrate this function into test system and utilize signals generated from the test system to control PEL-3000A(AH) Series.

BATT TEST AUTOMATION

BATT Test Automation Editing

Waveform of TEST Result

Sample of Data Log

The built-in BATT Test Automation of PEL-3000A(AH) provides battery discharge applications with more flexible discharge stop time setting as well as rise and fall Slew Rate for discharge current settings. Under CP, CC or CR mode, the conditions for stop discharge can be set respectively.

For instance, set the input voltage for stop discharge current, the execution time for discharge current or total discharge current*time (AH) to satisfy the verification of battery capability.

J. OCP TEST AUTOMATION

OCP test Automation for DUT(Power Supply), provide users with high resolution OCP measurement values to verify DUT's OCP activation point. It also provides users with measurement results so as to help them determine whether DUT's actual OCP activation point meets the regulations. It can test the value of OCP by setting load current increment from start current to stop current. OCP's activation point can be accurately measured.

K. OPP TEST AUTOMATION

OPP test Automation for DUT(Power Supply), provide users with high resolution OPP measurement values to verify DUT's OPP activation point. It also provides users with measurement results so as to help them determine whether DUT's actual OPP activation point meets the regulations. It can test the value of OPP by setting power increment from start power to stop power. OPP's activation point can be accurately measured.

TIMER FUNCTIONS

Elapsed Time

The PEL-3000A(AH) Series provides count time and cut off time functions. The display screen will show present activation time when electronic load is activated. When electronic load operation is terminated count time will stop and the total operation time will be shown on the display screen. The activation time of cut off time can be set to the maximum length of 999 h 59 min 59 s. When electronic load is activated

Voltage at Cut Off Time

this function will start counting time. Electronic load will cease operation (load off) and show the final input voltage on the screen when preset time is reached. Timer function can provides information and application related to time. Users can obtain the total time of limiting electronic load operation to increase the agility of electronic load tests.

M. MATER/SLAVE PARALLEL CONTROL

PEL-3111A(AH) can be used as either master or Slave. PEL-3111A(AH) can also be connected in parallel with PEL-3211A(AH) (Booster unit). Customers, based upon their DUT requirements, can collocate different models to meet their power requirements. The system collocation connection and terminals are all copper bar structure.

When the Master/Slave control mode is selected, Master will automatically calculate current sunk as soon as load has been activated. The system will automatically distribute current to each Master/Slave unit. For Master/Slave parallel collocation, users only enter settings and edit programs on Master. Logically speaking, Master/Slave parallel collocation can be regarded as one single load unit. Therefore, this collocation can safely provide load capacity with actual current and power in the respective level. Parallel collocation can also meet different current and power requirements.

- Note: *1 Full scale of H range.

 *2 Vin: input terminal voltage of electronic load.

 *3 M range applies to the full scale of H range.

 *4 Siemens[S] = Input current[A] / Input voltage[V] = 1/resistance[Ω]

 *5 Converted value at the input current. At the sensing point during remote sensing under the operating range of the input voltage. operation.

 *6 set = Vin/Rset.

 *7 At the sensing point during remote sensing under the operating range of the input voltage. It is also applied for the condition of the parallel operation.

 *8 It is not applied for the condition of the parallel operation.

 *9 Time to reach from 10 % to 90 % when the current is varied from 2 % to 100 % (20 % to 100 % in M range) of the rated current.

 *10. Minimum setting range and resolution will change in parallel (Detail please reference user manual)

- Note: *1 Full scale of H range.

 *2 Vin: input terminal voltage of electronic load.

 *3 M range applies to the full scale of H range.

 *4 Siemens[S] = Input current[A] / Input voltage[V] = 1/resistance[Ω]

 *5 Converted value at the input current. At the sensing point during remote sensing under the operating range of the input voltage. operation.

 *6 set = Vin/Rset.

 *7 At the sensing point during remote sensing under the operating range of the input voltage. It is also applied for the condition of the parallel operation.

 *8 It is not applied for the condition of the parallel operation.

 *9 Time to reach from 10 % to 90 % when the current is varied from 2 % to 100 % (20 % to 100 % in M range) of the rated current.

 *10. Minimum setting range and resolution will change in parallel (Detail please reference user manual)
