InfiniiVision HD3 Series Oscilloscopes

Making precision portable

Introduction

The HD3 Series brings Keysight's industry-leading capabilities from high-performance oscilloscopes to the high-volume level, making precision portable from 200 MHz to 1 GHz. Leveraging custom hardware technology from the UXR Series, the HD3 boasts impressive resolution with four times the vertical accuracy with a 14-bit ADC and half the noise floor. Paired with our fast, uncompromised waveform update rate and twenty-five times more memory, the HD3 Series can capture small signals with high vertical resolution.

See What You've Been Missing with Portable Precision

Meet the new generation of Keysight InfiniiVision oscilloscopes, the HD3 Series. The HD3 was created with high-performance technology leveraged from our high-speed UXR Series oscilloscopes, now making precision available in a much more portable form factor.

With the all-new architecture of the HD3 (including a custom 14-bit ADC and low noise front end), you can analyze all signals in your design with high vertical accuracy. This ensures you make the most accurate measurements possible and have the most realistic view into the signals inside your device.

You can achieve even greater accuracy (5x better) with up to 16 bits of resolution using the built-in per-channel bandwidth filters. Need to use the full bandwidth to 1 GHz? You will still get extremely high accuracy at the full bandwidth, with the ability to zoom to 500 uV/div.

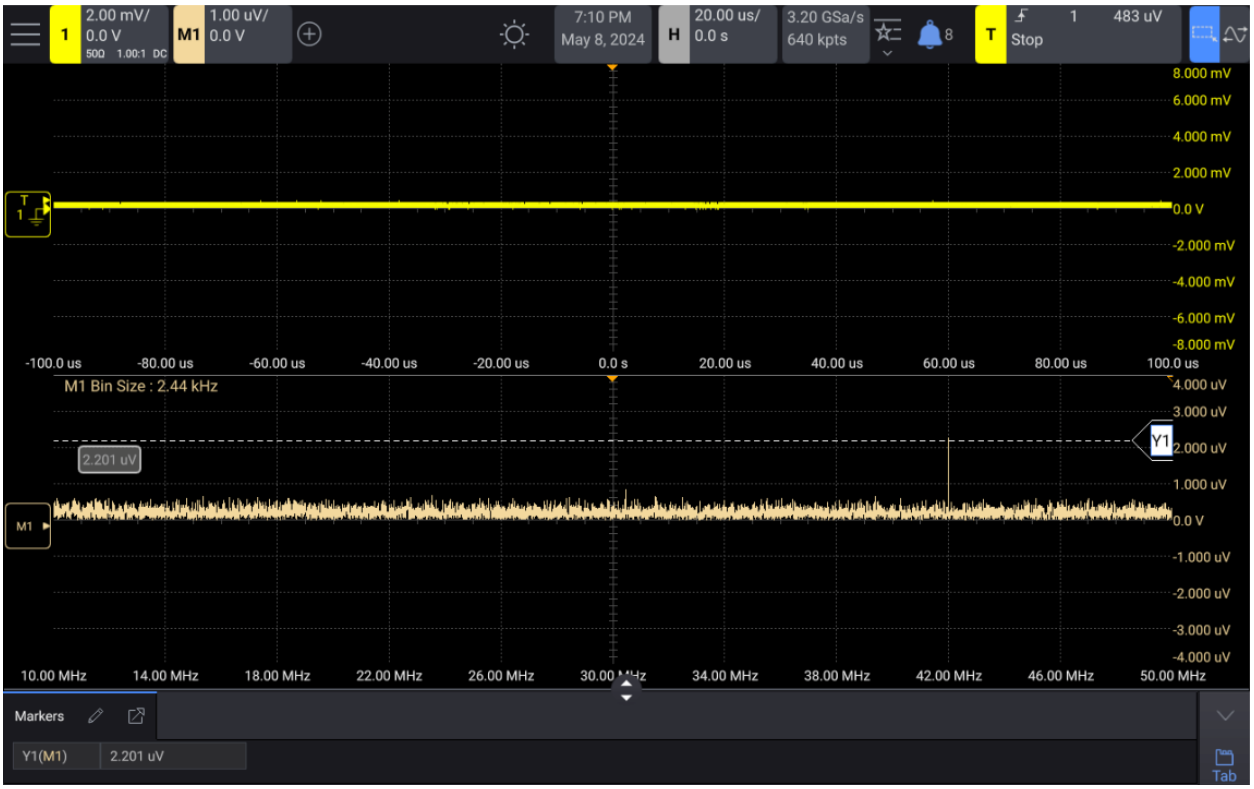

Figure 1. The oscilloscope captures a 2 uV, -100 dBm signal very clearly in our FFT. This same signal would not be viewable with a higher noise floor oscilloscope.

See What You've Been Missing with Custom Technology

The HD3 Series uses custom components optimized specifically for oscilloscope measurements. Keysight's R&D team designed a brand-new 14-bit ADC, an all-new ASIC, other support components, and an entirely new architecture for the signal to flow through. Because Keysight designs these components rather than using off-the-shelf components, our hardware works much faster and more efficiently since it is designed specifically for oscilloscopes.

Part of this new architecture also includes deep memory with dedicated memory chips for every channel (100 Mpts). This means there is no interleaving between channels. You can have all four channels turned on and still get the maximum memory and sample rate on every channel.

Our new custom ASIC (MegaZoom 5) enables the HD3 to have hardware-based functions such as zone trigger, serial decoding, and mask testing.

Custom hardware also makes it possible for us to create new custom software, such as the Fault Hunter software application. Simply run Fault Hunter and detect any glitches or errors on your signa.

See What You've Been Missing with Versatile Functionality

Dive deeper than ever before with more flexibility in the InfiniiVision user interface. Not only did we leverage the hardware from our high-performance oscilloscopes, but we also took some of the more advanced user interface capabilities and added them to the new InfiniiVision user interface. With more menus and user customization, you can set up the scope to be customized to your exact testing requirements. The custom grid display, favorites bar, and automatic actions make it even easier to dive deep into your characterization and view results quickly.

All models can be upgraded in bandwidth or memory using immediate license upgrades. There are no returns to factory required for any upgrades. All models are also already equipped with these standard functions that typically cost thousands of dollars:

- Frequency response analysis
- Fault Hunter
- Zone trigger
- Segmented memory
- MSO
- Mask testing
- Histograms
- FFT, and more

All-New Custom ASIC: MegaZoom 5

Traditionally, CPU processing was the major bottleneck for oscilloscope waveform update rate and responsiveness. This remains the case with many of our competitors. When the CPU handles things like interpolations, logic channel plotting, serial bus decoding, measurements and more, and the waveform update rate, memory, and sample rate drop dramatically as these features are turned on.

The InfiniiVision HD3 Series has an all-new MegaZoom 5 ASIC that was built from the ground up with none of the same architecture or components in our MegaZoom 4 in our previous InfiniiVision scopes. With this new custom ASIC, the HD3 oscilloscopes can do things in hardware instead of running in software through their CPU. With these functions being performed in hardware, the HD3 requires minimum support from a CPU. MegaZoom includes hardware serial decoders and hardware mask limit testing capability, plots analog and digital data directly to the display, supports GUI operation, and integrates additional instruments like the WaveGen function / arbitrary waveform generator.

The new features enabled by MegaZoom 5, combined with the supporting architecture around it, enables the HD3 Series to show the most realistic view of the signals inside your device.

Fault Hunter Software

Fault Hunter is an innovative, expert system for inspecting digital systems. It automatically evaluates your signal's characteristics against user-definable criteria, quickly finding and saving errors for your review. It's flexible, and you can define the test duration from a few minutes up to two days. Set up your device under test on a Friday afternoon and return Monday morning with a full test report to review, with billions of tests complete.
